Beyond Brainstorming

Actionable Classroom Resources via Google AI Studio

Moving Further

Ideation

Generative AI serves as a sounding board to brainstorm ideas, rubrics, and outlines. Educators still do the heavy lifting of drafting step-by-step instructions.

Generation

AI Studio enables multimodal generation. Videos and prompts synthesize visual actions into structured instructions, bridging the gap between demo and documentation.

Multimodal Workflow

- **Capture:** Record a short screen demo.
- **Context:** Upload video with a clear prompt.
- **Generate:** AI extracts exact visual steps.
- **Deploy:** Review the formatted assignment document.

Harnessing Visual AI

AI Studio interprets visual data over time, recognizing UI elements, cursor movements, and sequential logic.
It translates fluid visual demonstrations into concrete text, capturing nuances frequently missed in purely verbal explanations.

Prompt

Ready for the Classroom

Task: Landmark Analysis and Data Extraction in Fiji/ImageJ

Prerequisites:

- **Software:** Fiji (ImageJ) installed and open.
- **File:** An image of the specimen you wish to analyze (e.g., .JPG or .TIFF).

Step-by-Step Instructions:

1. Open Your Image

- In the Fiji menu bar, go to **File > Open...**.
- Navigate to your file location (e.g., GNC773.JPG from the Desktop), select it, and click **Open**.

2. Zoom and Position the Specimen

- Use the **Magnifying Glass tool**, the **scroll wheel** on your mouse, or the cmd+(Mac)/ctrl+ (Windows) to zoom in on the specific area of interest.
- If necessary, use the **Hand tool** to pan the image so the specimen is centered.

3. Select the Multi-point Tool

- Look for the icon that looks like a small cluster of points in the toolbar (the **Multi-point tool**).
- **Right-click** the icon to ensure "Multi-point" is selected rather than "Point tool." This allows you to place multiple numbered landmarks without the selection resetting.

From Screen to Activity

The final product is a tangible resource. What took hours of pausing, typing, and formatting is now generated in seconds. Instructions align perfectly with the visual demo, saving educator time.

Optimizing the Prompt

Assign Role

Start by giving the AI a persona, like "expert instructional designer."

Set Rules

Explicitly request numbered steps, bold terms, and warnings for pitfalls.

Anchor Video

Direct the AI to anchor all instructions specifically to the attached video.

Video Best Practices

- **Narrate Actions:** Explain "why" you click for better AI context.
- **Keep it Focused:** Limit videos to 3-5 minutes. Break up complex tasks.
- **Clear Movements:** Move the mouse deliberately to help AI track actions.
- **Provide Templates:** Paste standard rubrics directly into the prompt.
